

Nexus AI - Sample RAG Document

Nexus AI is a production-grade multi-agent AI platform built from scratch. The system includes an LLM layer, agent framework, tool calling system, retrieval augmented generation, memory, and workflow orchestration.

The RAG engine loads documents, splits text into chunks, generates embeddings, stores vectors in FAISS, and retrieves relevant context for AI agents.

Planner agents decompose user tasks into executable subtasks. Tools provide deterministic capabilities such as calculations. Future agents can use retrieved document context to reason and generate grounded responses.
